Phase Locked Loop Circuit with Self Adjusted Tuning
Hiep The Pham

ABSTRACT

A phase-locked loop (PLL) circuit includes a voltagecontrolled oscillator (VCO) having a first input to receive a
control voltage, one or more second inputs to receive one or
more tuning range control signals, and an output to provide an
oscillation output signal, a phase detector having inputs to
receive the oscillation output signal and a reference signal, a
charge pump having an input coupled to the output of the phase
detector and having an output to generate the control voltage, a
loop filter having an input to receive the control voltage and
having a control terminal, and a controller having inputs to
receive the control voltage, a high reference voltage, a low
reference voltage, and one or more mode signals, and having a
first output connected to the control terminal of the loop
filter and second outputs to generate the tuning range signals.
